

Game Data Flow

Prolog / JQuery Terminal

Flow Description

1. Game interface simulated terminal cmd prompt: JQuery/Ajax/JSON framework supports interface.
2. Remote Procedure Call via PHP cURL framework.
3. Execute game command via the PHP cURL html form submit framework to (4) Apache Web Server.
4. Apache Web Server receives the request and forwards it to (5) SWI-Prolog http framework.
5. SWI-Prolog http framework receives game cmd & executes a (6) form submit, invoking relevant (7) Prolog code, etc., which outputs (8) simple text to (9) SWI Prolog http framework, which converts it to (10) web page display as (11) http form action reply data. The (12) Apache server receives this (13) form return data, and send it to the calling (14) PHP framework which loads it into a (15) Document object model, where it extracts (16) the appropriate DOM->NodeData (the result of the game command) and forwards it back to (17) the game interface for display.
